### Abstract

The IAEA Terrestrial Environmental Radiochemistry Laboratory (TERC) provided a Proficiency Test (PT) on determination of anthropogenic and natural radionuclides in water, soil and simulated contaminated surface samples. This year's PT was designed to monitor and demonstrate the performance and analytical capability of the participating laboratories and to identify gaps and problem areas where further development is needed. The sample set was formulated to support these goals.

## 1 Description of Samples

- Sample 1: Spiked Water, anthropogenic and natural radionuclides, gross alpha and beta (GAB)
- Sample 2: Spiked Water, anthropogenic and natural radionuclides and GAB (environmental levels)
- Sample 3: Spiked Water, quality control sample, no data reporting and evaluation
- Sample 4: Japanese Soil, anthropogenic and natural radionuclides
- Sample 5: Simulated contaminated surface sample, gamma and beta emitting radionuclides
- Sample 6: Simulated contaminated surface sample, gamma emitting radionuclide (Cs-134)
- Sample 7: Simulated contaminated surface sample, beta emitting radionuclide (Sr-90)

## **1.1 Sample 1, 2 and 3, Spiked Water**

Matrix origin:

Drinking water sourced from Seibersdorf, Austria.

Sample preparation:

The raw water was gravimetrically spiked with known amounts of a prepared standard solution, containing a mixture of certified radionuclides and acidified to < pH 2 ( 0.05 M HNO<sub>3</sub>) for stability. The stability of the samples has been tested and guaranteed during the PT reporting period only. Sample 01 and Sample 02 were spiked with several radionuclides. This included H-3 and U isotopes for Sample 01 and Sr-90, Ra-226 and progeny for Sample 02. The identification of gamma emitting radionuclides is one of the tasks of this proficiency test, therefore they are not specified in advance.

The activity concentration and uncertainty were assigned by formulation, and control measurements by gamma-ray spectrometry, alpha spectrometry and liquid scintillation counting have been performed prior to shipment.

## **1.2 Sample 4, Japanese Soil**

The soil was collected on 25 September 2020 in Japan by the University of Tsukuba. It was milled and sieved, and the grain size fraction used for this exercise was 90-250 µm. The bottled samples were sterilised (25 kGy gamma dose) and the related certificate is available on the PT website. It contains caesium and naturally occurring radionuclides typically found in soils.

Approximately 100 g has been provided for gamma-ray spectrometry measurement.

The determination of target values and associated uncertainties of the anthropogenic and natural radionuclides has been carried-out by measurements in one laboratory and confirmed by measurements in another laboratory. The samples were characterized for gamma emitting radionuclides only.

### **1.3 Samples 5, 6 and 7, Simulated contaminated surface samples**

Three circles for surface contamination monitoring have been included in this proficiency test (Figure 1). They were prepared using our in-house printing technique. One blank sample of the same size, outlined with black ink (not-spiked) was also added for correction (Sample 08).

The blue ink was spiked with a gamma-emitting radionuclide, Cs-134. The exercise asked for its identification and activity to be reported (Sample 06).

The magenta ink was spiked with Sr-90 and the activity should be reported (Sample 07), with correction for Y-90 activity.

The mixed ink sample (blue and magenta) has been printed at a lower activity compared to the single ink circles for both radionuclides (Sample 05). Both Cs-134 and Sr-90 activity should be reported for this sample.

The reference date 2023-01-01 should be used for decay correction.

## 2 Evaluation of results

Results reported by participants were evaluated using the following stepwise approach.

The evaluation follows the methodology applied for the annual IAEA proficiency testing schemes in the areas of radionuclide measurements and trace element analysis.

### 2.1 Relative bias (Samples 1, 2, 4, 5, 6 and 7)

The relative bias is the relative difference between the reported and the target value (the best estimate of the true value)

$$Bias_{relative} = \frac{Value_{reported} - Value_{target}}{Value_{target}} * 100\%$$

The relative bias is compared to the Maximum Acceptable Relative Bias (MARB) which has been determined for each property value, considering the analytical methods, the analyte level in the sample and the complexity of the analysis.

When  $|Bias_{relative}| \leq MARB$ , the result will be rated "Accepted (A)" for trueness.

### 2.2 Evaluation approach for radionuclide activity concentration values (Samples 1, 2 and 4) and activity values per sample (Samples 5, 6 and 7)

Based on fit-for-purpose and good laboratory practice principles, the expanded relative uncertainty should cover the relative bias (as defined in 2.1):

The  $P$  value corresponds to the relative combined uncertainty of the relative bias

$$P = \sqrt{\left(\frac{u_{target}}{A_{target}}\right)^2 + \left(\frac{u_{reported}}{A_{reported}}\right)^2} * 100\%$$

The relative bias is then compared to the expanded uncertainty of the relative bias:

$$|Bias_{relative}| \leq k * P$$

where  $k$  is the coverage factor:  $k = 2.58$  for a level of confidence of 99%.

When the above criterion is fulfilled, the reported result is not significantly different from the target values considering the uncertainties associated with both values. The reported uncertainty of measurement is large enough to cover the bias of the method.

In addition, the  $P$  value is compared to the MARB.

$$P \leq MARB$$

When this criterion is fulfilled, the measurement uncertainty is not overestimated and fit-for-purpose in relation to the MARB criterion of this PT exercise. When both criteria related to the measurement uncertainty are fulfilled, the reported result is rated "accepted (A)" for precision (measurement uncertainty). The result is rated "Not Accepted (N)" for precision if either of the two conditions are not fulfilled.

The final score is assigned according to the detailed evaluation described above. The possible scores are listed below:

- "Accepted (A)" when both, trueness and precision were rated "Accepted"
- "Not Accepted (N)" when the trueness rating is "Not Accepted"
- "Warning (W)" when the trueness rating is "Accepted" but the precision rating is "Not Accepted"

### 2.3 Evaluation parameters calculated for intercomparison analyte values

#### 2.3.1 Z-Score

The z score provides information on the trueness of the reported value in relation to the standard deviation for proficiency assessment  $\sigma_{PT}$ , which is assigned based on fitness for purpose.

$$z = \frac{Value_{reported} - Value_{target}}{\sigma_{PT}}$$

The following criteria apply for performance ratings based on obtained z scores

- $|z| \leq 2$  ... accepted (A)
- $2 < |z| < 3$  ... questionable (Q)
- $|z| \geq 3$  ... not accepted (N)

### 3 Data Evaluation

A total of 316 laboratories successfully reported data in the IAEA-TERC-2023-01 proficiency test exercise.

For each of the analytes evaluated, the target value, target uncertainty and the MARB are listed. A pie chart showing the distribution of accepted, warning, not acceptable and not reported results, the s-shape graph, and a detailed table listing all evaluation results for the analyte (sorted by the laboratory code) are provided. The data points are coloured in blue, yellow and red, corresponding to a result of "Accepted", "Warning", and "Not Accepted", respectively.

#### 3.1 Evaluation of activity concentrations of radionuclides

##### Reported Results for H-3 determination in Sample 1

TABLE 1. Target values

Parameter	Value
Activity Concentration [ Bq/kg ]	29.0

## Reported Results for K-40 determination in Sample 4

TABLE 30. Target values

Parameter	Value
Activity Concentration [ Bq/kg ]	584
Uncertainty [ Bq/kg ]	20
Maximum Acceptable Relative Bias, [%]	30

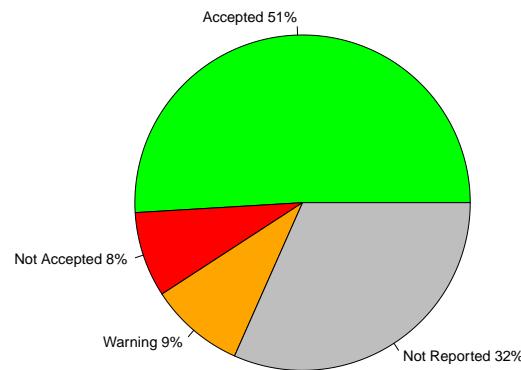

FIGURE 27. Percentage of Accepted vs. Warnings vs. Not Accepted vs. Not Reported results

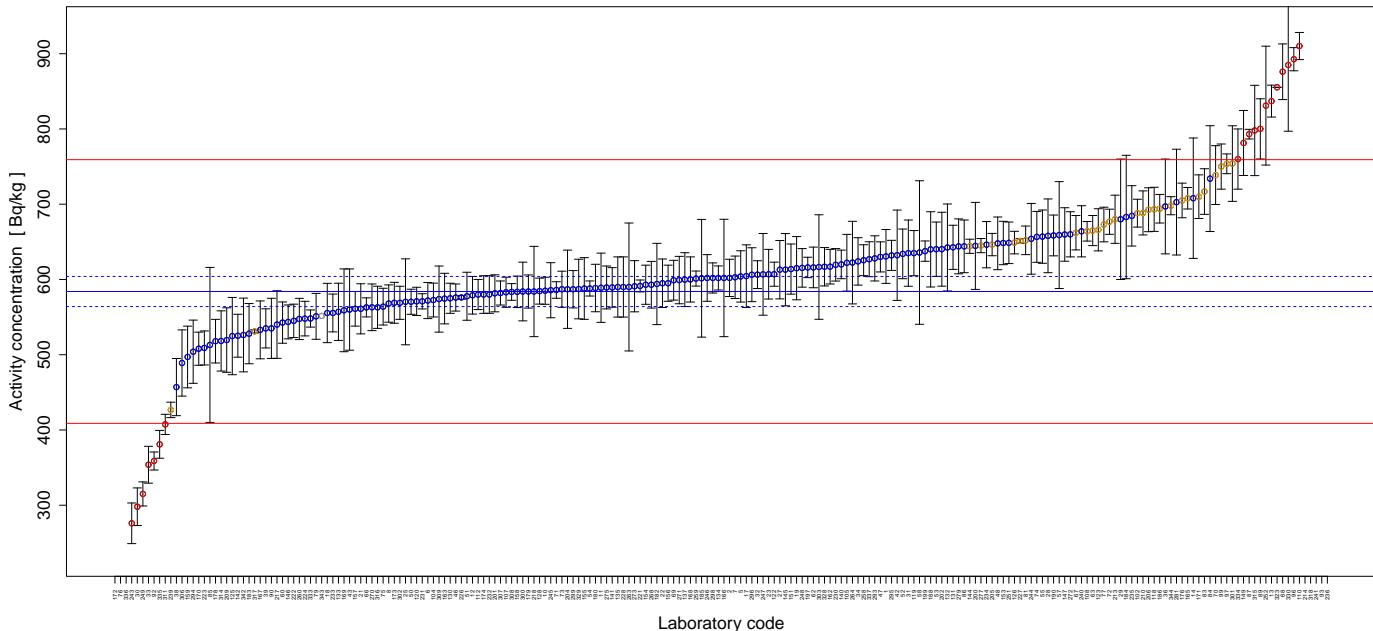

FIGURE 28. Reported results and evaluation parameters for K-40. Blue points represent accepted scores, whereas yellow and red represent warning and not accepted scores respectively.
